## WASHING MACHINE PD

The washing machine is designed to remove any stones, clods, and debris at the start of a wash system to ensure a significant reduction in product damage and bruising. Additionally, this design prolongs the life of subsequent wash line systems by ensuring only the intended product makes it through to the next stages along the wash line.

The process starts from the infeed. After the produce falls into the water, it floats to a rotating drum. While the produce floats, heavy stones, and debris sink into a waste belt and are effectively removed to prevent damage to the produce. The produce is transported by the rotating drum towards a product belt. During transport, the produce is cleaned by water inside the drum.

In washing machines PD type, the flow of produce is controlled by a valve, which can be operated manually or automatically. The height of the subframe can vary from 0-3 meters.

## SHAKE GRADER SG

The Allround Shake Grader is specifically designed to grade potatoes based on their square size using a four-dimensional grading system. The process begins when potatoes are placed onto the top sieve of the machine. These sieves play a crucial role in sorting as they move in a controlled manner, allowing the potatoes to travel across different levels for grading.

The shaking motion of the sieves is driven by a motor located at the front of the machine. This motor powers a crankshaft, which generates the movement required for the sieves to function effectively. As the crankshaft operates, it causes the sieves to shake, ensuring that the potatoes pass through the grading process efficiently and accurately.

To enhance performance, the motor features a computer-controlled frequency inverter. This advanced technology enables the sieves to operate at multiple sequential frequencies, optimizing the grading process. As a result, the machine ensures precise and consistent potato sorting.

Allround Vegetable Processing is a leading manufacturer of customized solutions for high-quality vegetable processing lines for potatoes, onions, and carrots. The company offers a range of machinery and equipment designed for receiving, sorting, washing, polishing, grading, topping, brushing, cooling, weighing & bagging vegetables intended to cater to small-scale & large-scale production, wholesale, retail, e-tail, fresh produce, processing export industries and pre-processing for french fries, potato chips, potato flakes, potato specialties, aalu bhujia, samosa & paratha lines.

# CONRAD-G

Gherkin is an 100% export crop grown in and around Karnataka. 50+ gherkin pickle exporters make India the second largest exporter in the world. Fruit fly infections in gherkins is detrimental to the export industry. Wide Mobility has developed a "first of its kind", "Make In India" X-Ray based inspection machine called CONRAD-G. The feeding, imaging and segregation are fully automated. CONRAD-G X-Ray images the gherkins, processes the image and classifies the same on predetermined criteria. Once classified, the gherkins are pneumatically separated, enabling the user to extract high quality gherkins from the incoming lot. CONRAD-G inspection techniques have better advantages over manual inspection methods. Infections are identified irrespective of their size, orientation. Pin-hole infections, infections which are visible/not-visible externally are also identified.
